

ABSTRACT OF THE DISCLOSURE

A photographic processor is in the form of an outside load drum processor. The outside load drum processor includes a circular member that includes a first wall, a second wall and a side-wall that connects the first wall to
5 the second wall and extends around a perimeter of the circular member. A flexible shield member is wrapped around an outer surface of the side-wall so that a processing path for photographic material to be processed is defined between at least the outer surface of the side-wall and the inner surface of the flexible shield member. The circular drum member is rotated for processing of photographic
10 film within the processing path.
